## Decision Making is Hard

## Why?

- Accurately assessing risk is challenging.
- Multiple sources of uncertainty.
- Gathering information requires resource expenditures.

## Decision Making is Hard

## Why?

- Accurately assessing risk is challenging.
- Multiple sources of uncertainty.
- Gathering information requires resource expenditures.

Decision Fatigue

- Decision quality declines under repetitive decision making.
- Reasoning over many options causes stress.
- We are better at relative rather than absolute comparisons.

- We are better at relative rather than absolute comparisons.

## All of which leads to ...

## Information Planning

## Bayesian Experimental Design

## Begin at the End

## Simple Wagers

sometimes not so simple

Assume the wager amount is paid prior to the coin flip.

$$
b=\text { amount wagered } \quad w=\text { win multiple } \quad p=\text { success probability }
$$

Reward

$$
r= \begin{cases}w b-b & ; \text { success } \\ -b & ; \text { failure }\end{cases}
$$

$$
\mathbb{E}\{r\}=(p w-1) b
$$

## Winning...in expectation

$$
\mathbb{E}\{r\}>0 \rightarrow\left\{\begin{array}{l}
p>\frac{1}{w} \\
w>\frac{1-p}{p}+1
\end{array}\right.
$$

So, the win multiple must be greater than the odds against winning (plus one to account for the prepaid wager amount).

## Simple Wagers

## sometimes not so simple

You have saved up $\$ 1,000,000$, I mean $¥ 100,000,000$. It is your life savings. With the previous analysis in hand, you're confident risking it all on a favorable wager.

$$
b=100,000,000 ¥ \quad w=21 \quad p=1 / 20
$$

## Simple Wagers

## sometimes not so simple

You have saved up $\$ 1,000,000$, I mean $¥ 100,000,000$. It is your life savings. With the previous analysis in hand, you're confident risking it all on a favorable wager.

$$
b=100,000,000 ¥ \quad w=21 \quad p=1 / 20
$$

## Careful Analysis

$$
\begin{aligned}
& w=21>\frac{19}{1}+1=\left(\frac{1-p}{p}+1\right) \\
& \mathbb{E}\{r\}=(p w-1) b=¥ 5,000,000
\end{aligned}
$$

## Simple Wagers

## sometimes not so simple

You have saved up $\$ 1,000,000$, I mean $¥ 100,000,000$. It is your life savings. With the previous analysis in hand, you're confident risking it all on a favorable wager.

$$
b=100,000,000 ¥ \quad w=21
$$

$$
p=1 / 20
$$

## Careful Analysis

$\checkmark w=21>\frac{19}{1}+1=\left(\frac{1-p}{p}+1\right)$
$\checkmark \mathbb{E}\{r\}=(p w-1) b=¥ 5,000,000$

Not bad, a 5\% return!

## Simple Wagers

## sometimes not so simple

You have saved up $\$ 1,000,000$, I mean $¥ 100,000,000$. It is your life savings. With the previous analysis in hand, you're confident risking it all on a favorable wager.

$$
b=100,000,000 ¥ \quad w=21
$$

$\checkmark w=21>\frac{19}{1}+1=\left(\frac{1-p}{p}+1\right)$
$\mathbb{E}\{r\}=(p w-1) b=¥ 5,000,000$

$$
p=1 / 20
$$

## Sharing the Wealth

Out of generosity, you share your analysis and convince 19 of your closest friends to make the same wager with their life savings.

Not bad, a 5\% return!

## Simple Wagers

You have saved up $\$ 1,000,000$, I mean $¥ 100,000,000$. It is your life savings. With the previous analysis in hand, you're confident risking it all on a favorable wager.

$$

$$

## Careful Analysis

$\checkmark w=21>\frac{19}{1}+1=\left(\frac{1-p}{p}+1\right)$
$\checkmark \mathbb{E}\{r\}=(p w-1) b=¥ 5,000,000$

## Sharing the Wealth

Out of generosity, you share your analysis and convince 19 of your closest friends to make the same wager with their life savings.

Not bad, a 5\% return!
There is a greater than $33 \%$ chance that not only will you lose all of your money, but ALL of your friends will lose their money, as well! ©

## Simple Wagers

the distribution of risk/rewards matters too!

Distribution of Rewards

- For a one-time wager, the expected reward is not useful.
- The distribution of risk is a better descriptor.

## Simple Wagers

the distribution of risk/rewards matters too!

- Why not amortize over multiple trials?
- Even at 170 trials the probability of a loss is great than $50 \%$.

## 20 trials <br> 

## Simple Wagers

the distribution of risk/rewards matters too!

- Why not amortize over multiple trials?
- Even at 170 trials the probability of a loss is great than $50 \%$.

- At this point, our best "bet" is to improve our odds.
- Information becomes an important and quantifiable factor.

## Actionable Information

## Actionable Information

## Why are we collecting data?

...information is actionable if it is prescriptive of actions that can be taken to either improve upon the state of uncertainty for a particular task or allow one to accurately evaluate the cost of ancillary decisions related to the task.

> -original source in dispute

The perfect is the enemy of the good.
-Voltaire, 1764 (though, he probably said it in French)

## Information and Risk

Kelly [1956]
$B=\sum_{i} b_{i}$ is the total sum invested in different outcomes.

$$
b_{i}=\text { wager } i \quad w_{i}=\text { win multiple } i \quad p_{i}=\text { success probability } i
$$

Reward

$$
r_{i}=w_{i} b_{i}-B
$$

$\mathbb{E}\{r\}=\sum_{i} p_{i} r_{i}=\sum_{i} p_{i} w_{i} b_{i}-B$

Some observations

- If all $p_{i} w_{i}=1$ then the game is fair, $\mathbb{E}\{r\}=0$ for any choice of $b_{i}$.
- If any $p_{i} w_{i}>1$ then allocating everying to the $\max _{i} p_{i} w_{i}$ maximizes $\mathbb{E}\{r\}$.
- Maximizing the expected reward over repeated trials $\rightarrow$ Gamblers ruin.
- Maximizing the rate of reward over repeated trials avoids ruin, but requires information to succeed.

## Information and Risk

## Repeated trials and rates Kelly [1956]

$X_{n}$ is the outcome of the $n$th investment. It is random with distribution $p$.
$b(X)=$ allocations $\quad r(X)=b(X) w(X)$ relative wealth increase
Growth Rate ${ }_{n}$

$$
\begin{aligned}
r_{n} & =\prod_{k=1}^{n} r_{k}\left(X_{k}\right) \\
& \doteq 2^{n W(b, p)}
\end{aligned}
$$

$$
W(b, p)=\mathbb{E}(\log r(x))
$$

$=\sum_{i} p_{i} \log b_{i} w_{i}$

Optimal Rates \& Information

- $b_{i}=p_{i}$ optimizes $W(b, p)$ (growth rate is zero for a fair game).
- But $p$ an estimate, information yields an edge.
- With data $p(X) \rightarrow p(X \mid Y)$.

$$
W(p(X \mid Y), b(X \mid Y))=I(X ; Y)
$$

## Representations: More than Answers

## The Blind Men and the Elephant

The Blind Men and the Elephant
John Godfrey Saxe (1816-1887)
It was six men of Indostan To learning much inclined, Who went to see the Elephant (Though all of them were blind), That each by observation Might satisfy his mind
...six stanzas in which
each demonstrates that they have
questionable judgement... ${ }^{\text {a }}$
And so these men of Indostan
Disputed loud and long,
Each in his own opinion
Exceeding stiff and strong,
Though each was partly in the right,
And all were in the wrong!

[^0]

## The Blind Men and the Elephant

The measurement is rarely the answer

The Blind Men and the Elephant
John Godfrey Saxe (1816-1887)

Interesting models generally have complex structure described by a graph. Measurements (shaded nodes) depend on different aspects of the latent representation (unshaded nodes). Reasoning often involves functions of a subset of the latent variables.

## Information Measures and Experimental Design

(1) A broad class of information measures - $f$-divergences - are fundamentally linked to bounds on risk. [Bartlett et al., 2003, Nguyen et al., 2009]

- $f$-divergences: expectations of convex functions of the likelihood ratio.
- $f$-divergence $\rightarrow \phi$-risk $\rightarrow$ bound on excess risk
(2) Submodularity - as applied to information measures - is a key enabler. [Krause and Guestrin, 2005, Williams et al., 2007a, Papachristoudis and Fisher III, 2012]
- off-line and on-line performance bounds
- guarantees on tractable planning methods
- incorporation of inhomogenous resource constraints
(3) Submodular properties are intimately related to the structure of graphical models. [Williams et al., 2007a]
- local properties (and computations) yield global guarantees

## Submodularity

## Diminishing Returns

- For a set $V$, a function $f: 2^{V} \rightarrow \mathbb{R}$ is submodular if

$$
f(A)+f(B) \geq f(A \cup B)+f(A \cap B) \quad \forall A, B \subseteq V
$$

- The set increment function is defined as

$$
\rho_{S}(j) \triangleq f(S \cup j)-f(S) \quad j \in V, S \subseteq V
$$

A real-valued function is submodular if

$$
\rho_{A}(j) \geq \rho_{B}(j) \quad \forall A \subseteq B \subseteq V \text { and } j \notin B
$$

i.e., $j$ has greater incremental value relative to $A$ than to any $B$ containing $A$.

- Monotonicity: A real-valued $f$ is monotone if

$$
f(A) \leq f(B) ; \forall A \subseteq B \quad \text { or } \quad \rho_{S}(j) \geq 0 ; \forall j \in V, S \subseteq V
$$

## Efficient Information Planning

Tractable greedy selection achieves near-optimal performance.

Williams et al. [2007b] reduces complexity of information gathering formulated as a Markov Decision Process.

$$
O\left(\left[N_{s} 2^{N_{s}}\right]^{N} M^{N}\right) \rightarrow O\left(N N_{s}^{3}\right)
$$

Williams et al. [2007a] the optimal information gathering rate is no greater than twice the greedy information gathering rate.

$$
\frac{I\left(X ; Z_{N}^{G}\right)}{I\left(X ; Z_{N}^{*}\right)} \geq \frac{1}{2} \quad \forall N
$$

$N_{s}$ : number of sensing actions, $N$ : planning horizon, $M$ : measurement simulation cost.

## Case Study: Oil \& Gas Production

## Goal:

- Develop a model and inference algorithm for an off-shore well system.
- Plan a sequence of well tests to estimate unknown properties of the reservoir and each well.

## 1. Model

- Each well has unknown productivity index (PI), gas-to-oil ratio (GOR), water-cut (WC). $\approx 400$ nuisance variables. $\approx 1000$ pressure and flow rate measurements.
- Graphical models are used to illustrate structure useful for inference. Gaussian processes are learned to efficiently model multi-phase flow.

## 2. Posterior distribution

- Use MCMC to sample from the posterior distribution $p(\theta \mid y)$.
- Slice sampler has faster mixing; the required extra computation can be parallelized.

## 4. Planning

- Taking a measurement is costly and time-consuming, so we would like to select informative measurements.

## 3. Model checking

- Empirically check that measurements from the real system are within the predictive quantiles.

## Planning

- We maximize mutual information between $\theta$ and $Y$ :
$I(Y, \theta)=\int p(y) \log p(y) d y-$ $\iint p(\theta) p(y \mid \theta) \log p(y \mid \theta) d \theta d y$.
- Draw samples $\left(\theta^{(i)}, y^{(i)}\right)$ from $p(\theta, Y)$, then:

First term

$$
\begin{aligned}
& \approx \frac{1}{N_{y}} \sum_{i=1}^{N_{y}} \log p\left(y^{(i)}\right) \\
& \approx \frac{1}{N_{y}} \sum_{i=1}^{N_{y}} \log \frac{1}{N_{\theta}} \sum_{k=1}^{N_{\theta}} p\left(y^{(i)} \mid \theta^{(k)}\right)
\end{aligned}
$$

Second term

$$
\approx \frac{1}{N_{\theta}} \sum_{i=1}^{N_{\theta}} H\left(Y \mid \theta^{(i)}\right)
$$

## Application: Planning well tests

 Well-separator routings can be configured in each test segment. A feasible set of routings are provided by domain experts.

Results - planned vs. expert:

## Case Study: Learning to Count

## Application: Estimating Electrification Status

## Hierarchical Beta Models with Latent Structure

Probabilistic Graphical Model

Joint Distribution Between Neighbors
Dependence via Latent Structures

Increasing neighborhood size $\rightarrow$

## Case Study: Kayonza District in Rwanda

Posterior Analysis

Multi-Modal Data Fusion

Transformation
Number of High-to-Low Voltage
Transformers:

Building Density:

Number of Heads

Number of Flips
